

**ABSTRACT**

A medicated ink marker includes a porous applicator and at least one medicated agent disposed within the porous applicator. The medicated ink marker makes no use of  
5 a reservoir from which to draw the at least one medicated agent. The at least one medicated agent is one of a non-antiseptic medicated agent and an antiseptic with an additional therapeutic function medicated agent. The porous applicator supports capillary action, such that contact of the applicator against a targeted location results in the at least one medicated agent dispensing from the porous applicator to topically apply  
10 the at least one medicated agent to the targeted location in a detectable manner without drawing additional medicated agent from another location, such as a reservoir.
